DETAILED ACTION

Allowable Subject Matter

1. Claims 50-54, and 56-90 are allowed.
2. Claims 68-90, previously withdrawn from consideration as a result of a restriction requirement, require all the limitations of an allowable claim. Pursuant to the procedures set forth in MPEP § 821.04(a), the restriction requirement between Groups I-IV, as set forth in the Office action mailed on 08/19/2008, is hereby withdrawn and claims 68-90 are hereby rejoined and fully examined for patentability under 37 CFR 1.104. In view of the withdrawal of the restriction requirement, applicant(s) are advised that if any claim presented in a continuation or divisional application is anticipated by, or includes all the limitations of, a claim that is allowable in the present application, such claim may be subject to provisional statutory and/or nonstatutory double patenting rejections over the claims of the instant application. Once the restriction requirement is withdrawn, the provisions of 35 U.S.C. 121 are no longer applicable. See *In re Ziegler*, 443 F.2d 1211, 1215, 170 USPQ 129, 131-32 (CCPA 1971). See also MPEP § 804.01.
3. The following is an examiner's statement of reasons for allowance: The prior art fails to teach or render obvious the invention as claimed.

Newberg (U.S. 6,491,283) was considered most pertinent to applicant's disclosure. Newberg discloses a valve (fig. 9) comprising a body (10, 100) having first (103) and second open (32) ends and a passageway (11) for fluid between the ends, the first end including a first coupling means (105) for sealingly connecting the body about an opening of a first external device (not shown) and a seal (21, 84) blocking an

open area (20; fig. 1) of the first end, the valve further including a seal displacement means (74, 130, and piston in combination) movable within the body so as to interrupt the seal permitting fluid to pass along the passageway (11) between the ends (103, 32), the coupling means (105) and the seal presenting a sterilisable mating surface for sealingly mating with a mating surface about the opening in the first external device, wherein the seal is formed between a first plastics portion (84) movable by the seal displacement means and a second plastics portion (21) disposed about the open area of the first end of the valve; wherein the second plastic portion has a protruding sharp rim (fig. 9) and the first plastic portion (84) of the seal has a curved surface area (fig. 9) so that when the valve is in the closed position, the sharp rim (edge of 21) engages the curved surface area and displaces a portion of the curved surface area thereby elastically deforming the materials of the sharp rim and the curved surface area to seal the opening of the valve; wherein the second plastic portion comprises a wall defining a bore portion having a cross-section converging towards the first end of the valve which in turn leads to a wall defining a bore portion (fig. 3) having a substantially uniform cross-section which is located adjacent the first end of the valve, the boundary between the wall defining the converging bore portion and the wall defining the uniform bore portion defining the sharp rim, the first plastic portion having a body portion (74) with a cross-section converging towards the first end of the valve and leading to an end portion with a uniform cross-section, the end portion being adjacent the first end of the valve in use and a transitional surface between the external surface of the body portion (100) and the external surface of the end portion of the first plastic portion defining the curved

surface area so that when the opening of the valve is sealed the sharp rim engages the curved surface area and displaces a portion of the curved surface area thereby elastically deforming the materials of the sharp rim and the curved surface area.

However, Newberg does not disclose wherein each of the wall defining the converging bore portion and the wall defining the substantially uniform cross-section bore portion is non-tangential with respect to any point of the portion of the curved surface are which is displaced by the sharp rim. Modifying Newberg's wall to be non-tangential is not an obvious modification since such a modification would affect the seal between 74 and 84.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. U.S. Pats. Stern (3,367,626), Kujawski (4,421,298), Walker (3,985,332), Purdy (2005/0121642), and Roach (3,395,725) disclose valves wherein a sharp rim contacts a valve member to form a seal.
